## EDUCATION

### California State University Long Beach

Long Beach, CA

*Bachelor of Arts in Computer Science*

*August. 2022 – Present*

- Relevant Coursework: Software Development with Frameworks, Database Fundamentals, Data Structures and Algorithms, Object Oriented Application Development, Computer Architecture, Assembly Programming

## PROJECTS

### IPO Analyzer | *React, TypeScript, FastAPI, Python, PostgreSQL, AWS, Claude API, MCP* Feb. 2025 – Present

- Engineered a fullstack IPO analyzer using React, TypeScript, and FastAPI that fetches live data from the Nasdaq API and renders 30+ IPOs on an interactive calendar
- Built an MCP server exposing IPO data retrieval, risk scoring, and ticker comparison as standardized tools callable by any MCP-compatible AI agent
- Implemented PostgreSQL caching with SQLAlchemy to persist LLM results, eliminating redundant API calls and cutting response time by 90% on repeat requests
- Deployed the full stack to AWS using Lambda, API Gateway, RDS, and S3 static hosting, then configuring CORS and IAM permissions across the cloud services

### Pokemon Team Builder | *React, Node.js, Express, FastAPI, Python, MongoDB* Jan. 2026 – Present

- Built a fullstack web application with a React, REST API, and FastAPI allowing users to search, assemble, and save custom 6 Pokémon teams to cloud MongoDB database
- Reduced redundant PokeAPI requests by over 80% by consolidating 3+ endpoints into a single aggregated Express route returning Pokémon names, types, moves, and sprites
- Designed a 2 layer caching architecture using MongoDB Atlas to persist Pokémon data across server restarts, eliminating repeat external calls for previously searched Pokémon

### Options Analytics Dashboard | *React, FastAPI, Python, NumPy, REST APIs* Oct. 2025 – Dec. 2025

- Developed a fullstack options analytics platform with a React frontend and FastAPI backend, simulating 20,000 GBM price paths per ticker to estimate ITM probability and expected value across 15 strikes for calls and puts
- Automated live options chain fetching through Yahoo Finance, extracting implied volatility per strike to compute breakeven prices, profit probability, and mispricing ratios
- Constructed a EV heatmap dashboard for users to detect underpriced and overpriced contracts to buy or short

## EXPERIENCE

### Freelance Software Engineer

July 2026 – Aug. 2026

*On-Chain Analytics & Risk-Scoring Discord Bot*

*Remote*

- Built and shipped a Discord bot that flags risky memecoin tokens in real time, combining live on-chain data with an AI reasoning layer
- Automated token research by pulling live price, liquidity, volume, and holder data for any token address, then flagging suspicious buying patterns automatically

## TECHNICAL SKILLS

**Languages:** Python, JavaScript, TypeScript, HTML/CSS, C++, C#, Java, SQL

**Frameworks:** React, FastAPI, Express, Node.js, Flask, Next.js, Supabase, Django, Vite, Tailwind CSS

**Developer Tools:** AWS (Lambda, API Gateway, RDS, S3), Git, GitHub, VS Code, MongoDB, Vercel, Railway, Docker, PostgreSQL, SQLite, npm/pip

**Libraries:** pandas, NumPy, Matplotlib, Selenium, TensorFlow, requests, SQLAlchemy, OpenCV, scikit-learn, node-cache, Pydantic, yfinance
